Discussion Questions

1. The paper does not provide any quantitative experiments. Are you convinced of its effectiveness? Are there any suitable evaluation metrics / benchmarks that the authors could have used?

2. Is representing video via text (by captioning) sufficient? Are there any scenarios where this wouldn't work well?

3. Are there any better ways to bridge the modality gap between video and text rather than mapping video into text and feeding it into for an LLM?

4. Is the answer to most multi-modal understanding problems just to "throw it into an LLM" at this point?

5. What are the advantages and disadvantages of using LLMs for video QA/dialoging?

6. Is this a good paper?

7. Does video understanding necessarily have to involve language modality?

8. Would the proposed approach work on long videos?

9. Are LLMs going to take over computer vision like they did NLP? If so, how should academic researchers co-exist with companies like OpenAI?
